

# LSIS Investment Report

Preliminary Round

Team Name: The Wealth Society

School: Santa Laurensia

# 1 Introduction

## 1.1 Investment Goal

Our strategy is fundamentally long-term, but we are aware of the short-term competition timeframe. Therefore, while we prioritize the long-term fundamentals, we select stocks with identifiable short-term catalysts that can drive outperformance near-term. We aim to achieve risk-adjusted outperformance relative to the LQ45 by taking advantage of both fundamentals and strategic allocation by diversifying across sectors to reduce volatility and protect against drawdowns. Our target is to achieve +1–2% outperformance versus the LQ45 over the simulation period while maintaining disciplined risk management

## 1.2 Stock Criteria

Our stock selection is fundamentally driven, prioritizing companies with consistent 5-year revenue and net income growth, high profitability (gross/net margins above competitors), and strong balance sheets with low debt, healthy D/E ratios, and positive FCF. We aim for businesses with attractive metrics (ROE, ROA, ROIC), justifiable valuations (P/E, Forward P/E, P/B, P/S, PEG) relative to competitors and historical valuations, and clear competitive advantages (moats) such as pricing power, economies of scale, brand strength, or network effects. Selection is limited to liquid large-cap LQ45 stocks with daily trading turnover above IDR 50B to ensure smooth entry/exit during the simulation. We also look for catalysts like earnings announcements, policy shifts, dividends, or sector momentum, while prioritizing exposure to structural growth drivers including digital banking, telecom data, EV adoption, and Indonesia's rising middle class. Finally, we apply risk management by diversifying across sectors and avoiding companies with persistent negative FCF or eroding market share.

## 1.3 Macroeconomic Outlook

The Asian Development Bank (2025) projects growth of 5.0% in 2025 and 4.0% in 2026, while the IMF (2025) and OECD (2025) present slightly different but consistent forecasts. Increased investment and government spending should also stimulate economic activity in the second half of 2025. Indonesia's GDP grew by 5.12% YoY in 2025Q2, a slight increase from the 5.05% recorded in 2024Q2 (Statistics Indonesia [BPS], 2025a; SKHA Consulting, 2025). This is largely driven by household consumption (making up >54% of real GDP growth), exports, and investment, driven by government spending through fiscal stimulus and expanded social assistance.

Indonesia's headline inflation rate has been quite low at 2.31% YoY in August 2025, with core inflation at 2.17% YoY in August 2025 easing compared to previous months (Statistics Indonesia [BPS], 2025b), in line with BI's inflation target of 1.5%-3.5%.

With inflation still within the target, BI initiated an easing cycle from September 2024, bringing the rate down from 6.25% to 4.75% (150 bps) by September 2025, which is expected to boost near-term loan growth and support bank valuations.. Bank Indonesia surprised markets in August 2025 with a 25-basis-point rate cut, aiming to support growth despite external risks (Reuters, 2025a; Trading Economics, 2025a). This is in order to stimulate economic growth given that inflation is still kept under control.

Indonesia's exports rose 9.7% in May 2025, extending the trade surplus (Reuters, 2025b), driven by iron and steel, nickel, and palm oil.

Consumer spending showed a 3.1% increase in 2025Q2 compared to 2025Q1 (Trading Economics, 2025). However, consumer confidence declined from 118.1 points in July 2025 to 117.2 in August 2025 (Samuel Sekuritas Indonesia, 2025a), possibly due to weaker perceptions of job availability and current job conditions. Thankfully, consumer optimism has increased for income gains in the next six months, as reflected in surveys from Trading Economics (2025b) and Samuel Sekuritas Indonesia (2025a).

Prabowo's 2025 administration in Indonesia is expansionary as Indonesia's fiscal deficit for 2025 has been revised up to 2.78% of GDP, bringing it close to the legal ceiling of 3%. This is in order to fund social programs like the Free Nutritious Meals initiative through cutting budgets, establishing Danantara, and accelerating licensing reforms to attract investment (Bloomberg, 2025). However, this raises concerns from investors about the long-term sustainability and the focus on social spending over infrastructure.

The Rupiah has weakened to 16,650 per USD on 24 September 2025 because of several reasons. First, the surprise rate cuts by BI, because markets anticipate further aggressive easing, which makes it unattractive for foreign investors and decreases the Rupiah's value. Second, the strong US dollar which pulls investment and demand towards USD assets because of the relatively high interest rates and yields. Furthermore, global uncertainty makes investing in emerging markets too risky, reducing demand. Third, concerns over the government's fiscal policy, especially with the large spending programs, as well as the independence of the Central Bank.

These conditions support credit growth and consumer spending, which will help strengthen our stock picks.

## 2 Analysis

We selected four large-cap Indonesian companies all listed on the LQ45 along with the required AALI to form a well-diversified, fundamentally strong portfolio. They all will share common characteristics such as strong fundamentals, high market cap and liquidity, competitive advantages (moats), exposure to growth opportunities, and growth + resilience. We've incorporated a mix of defensive sectors with growth-oriented sectors to align with both long term (10Y+ horizon) and near-term growth.

### 2.1 BBRI (30%)

A major Indonesian state-owned bank that focuses heavily on micro, small, and medium-sized enterprises (MSMEs).

#### Growth and profitability

Strong revenue growth after the pandemic as it reaches a peak of 21% YoY in 2021, but recently has been slowing. Net income growth has been pretty much flat in 2024 compared to 2023. In 2025Q1, BRI recorded a net income of IDR15.98T, an 5.5% increase YoY (Samuel Sekuritas Indonesia, 2025b). High operating margins (40%+) and net margins (~30%).

#### Balance sheet

Moderate financial leverage with debt-to-equity at 0.65 in 2025Q2. High ROE at 18.07% and ROA of 2.68% as of September 2025 TTM (Wisesheets, 2025). Its NIM is projected to improve to 7.3-7.7% (Samuel Sekuritas Indonesia, 2025b).

#### Valuation

BBRI trades at a decently cheap valuation. As of September 2025, its P/E is at 12.7x, with a P/B of 2.3x (Yahoo Finance, 2025). FY2024 P/E was ~10x, historically low. Its P/B is ~1.90x and P/S at ~4.6x, both historically low as well. It also has an attractive dividend yield of 8%-9%, which is a plus. However, its PEG is considered quite high at 2.11 currently. On the other hand, it does have a relatively lower forward P/E of 9.93. Historically, BBRI trades at higher valuations, so the current fall may be justifiable given the low revenue growth currently. BBRI is at cheaper valuations relative to BBKA on P/E, P/B, and offers a higher dividend yield, which will be a value play for us, thus justifying its higher allocation.

#### Competitive advantages

Unrivaled rural & SME network. It has ~30,000 branches, serving small farmers and businesses. This network yields cost-effective funding (high CASA) and sticky customers. It holds ~40% market share in micro-lending. BBRI's brand is associated with rural credit, and there are high switching costs for its small borrowers. However, it faces rising fintech lenders and regulatory changes that may erode low-end margins. Overall it enjoys a wide moat in microfinance, though limited in corporate banking.

#### Growth drivers

BBRI's long-term growth will be supported by current macroeconomic conditions like GDP growth projected at 5.0% in 2025 (Asian Development Bank, 2025), stable inflation at 2.9% in August 2025 (Statistics Indonesia [BPS], 2025b), and Bank Indonesia's recent 25 bps rate cut (Reuters, 2025a). Key drivers are expansion of micro- and consumer loans, digital banking (BRI Mobile), and cross-selling of insurance/wealth products. Catalysts are further BI easing, which could increase credit demand for consumers and micro loans (Reuters, 2025a). Furthermore, government support/subsidies for small developers/homeowners could lead to lending opportunities to state banks like BBRI (Reuters, 2025c).

#### Risks

Main risks are credit and economic risk. If the economy slows down, small borrowers may default. Rising interest rates could pressure loan growth and NPLs. Policy risk is also high given BBRI is a state bank. Furthermore, BBRI's dividend payout (TTM) is very high at 91.19% (Investing.com, 2025), which might not be sustainable and also limits reinvestment.

#### Competition

BBRI's main competitors are Bank Mandiri, BNI, but none match its rural presence. There may also be fintech startups that could be future competitors.

#### Technical

In the 6M–1Y period, the trend is down, with the stock forming a lower high and now a lower low. Trendline analysis shows a breakout from the downtrend, with resistance at 4,240. If the price stays above 4,000, the trend may reverse upward toward 4,370. However, if it breaks below 4,000, it may fall to the next strong support at 3,700. Using the 50- and 200-day MAs, the long-term trend remains below both (bearish), but short term, the price is above them (early breakout signal). Monthly net volume shows ~3,436M in selling pressure, indicating persistent selling. Compared to LQ45, BBRI's 1Y return of -21.55% lags the index's -17.30%, underperforming 1.25x. Overall, while fundamentals are strong, technicals remain mixed and slightly bearish, showing early breakout signs but still a downtrend bias.

## 2.2 BBKA

BBCA is Indonesia's largest private bank with the highest market cap.

#### Growth and profitability

2025Q1 net income was IDR14.1T, a 9.8% YoY increase. Loans grew 12.6% YoY, with CASA increasing 8.3% YoY (PT Bank Central Asia Tbk; Samuel Sekuritas, 2025). Revenue increased by 47% over the last 5 years at a 8% CAGR. Net income increased by 104% over the last 5 years at a 15% CAGR, indicating stronger profitability. Net margins are impressive at ~50%. 2025Q1 NIM is at 5.8%.

#### Balance sheet

Strong balance sheet. Cash and cash equivalents at 89.81T with total debt at 2.43T. High ROE in 2024 at ~21%. ROA at ~3.9%. 2025Q1 ROE is at 26.2%, as well as ROA at 4.3%, showing improvements in efficiency (BCA corporate presentation; 1H25 results).

#### Valuation

Premium valuation. Trailing P/E in FY2024 was 19.6x, and a current 17.7x (TTM), with P/B at ~4.4x. This is high relative to peers like BBRI or Mandiri. P/S ~8.9x, showing high margins. Historically, current valuations are on the lower-end. It pays a 3-4% dividend yield. PEG is also quite high at 2.10. Overall, valuation is premium relative to peers but cheaper compared to its historical valuations. This is because BBCA is priced for quality and earnings durability, this justifies its allocation being the second highest in our portfolio, given its earnings stability and lower credit volatility (Yahoo Finance).

#### Competitive advantages

Highest CASA ratio at ~82%, giving superior liquidity. Dominant brand, and high consumer trust. It also led digital innovation (digital banking) in Indonesia, building a huge scale. There is also the network effect of many depositors and low-cost funds. Wide moat overall.

#### Growth drivers

It grows by expanding loans in corporate, SME, and consumer segments. Catalysts are continued loan growth (mortgages, SME) and sustained CASA, which will support margins and earnings visibility (BCA corporate presentation; 1H25 results). Not only that, lower interest rates can boost loan demand but also compress NIMs, we'll have to watch closely for this. Lastly, the strong dividend track record and inclusion in dividend indexes may attract dividend yield-seeking funds if risk on sentiment returns (IDNFinancials, 2025).

#### Risks

Competition from fintech or other banks could pressure margins. Premium valuation limits near-term upside if macro weakens. Other downside risks are potential increases in NPL and falling NIM (Samuel Sekuritas; BCA).

#### Competition

Banks like BRI and Bank Mandiri.

#### Technical

Over 6M–1Y, BBCA is in a downtrend, forming a lower high and likely another lower low. The stock typically bounces at support 7,000 and faces resistance near 8,250. Using 50- and 200-day MAs, both short and long-term trends are below averages, confirming a continued downtrend. Monthly net volume shows ~3,942M in selling pressure. On a 1Y basis, BBCA's -30.05% return underperforms LQ45's -17.53% by 1.7x. Overall, technicals show clear downtrend and underperformance, contradicting the fundamentally positive outlook in the 6M–1Y horizon.

### 2.3 TLKM (20%)

A government-controlled telecom incumbent.

#### Growth and profitability

Revenue over 5 years grew at a slow and steady rate (1-3%), with revenue at ~150T in 2024, a 0.5% increase from 2023. Net income was IDR 23.65T in 2024, down ~3.7% from 24.56T in 2023 (Telkom Indonesia, 2025). The slight decline shows saturation in mobile voice/data and higher costs. High EBITDA margin at ~50%, gross margins at ~33%, operating margins at ~27%, and net margins at ~14% in 2025Q2. Free cash flow is also strong and growing, thanks to recurring revenue from Telkomsel and IndiHome.

#### Balance sheet

Moderate debt levels. D/E at ~0.47 in 2024. Most debt are used to fund its infrastructure (tower, fiber). ROE is solid at ~19.3x in 2024, and ROA at ~9.2x. Dividend yield at 8-9% is also high.

#### Valuation

Moderate multiples. Trailing P/E at ~11.4x, with a forward P/E of ~11.7x. P/B at ~1.65x, P/S at ~1.8x, reflecting stable cash flows. Its P/FCF is low (7.5x in 2024), showing strong FCF generation. PEG at ~1.3 in 2024, showing fair valuation given the modest growth expectations. Historically, its P/E ranges around 13-18x, so current valuations look cheap. Valuation suggests limited growth is priced in, but strong FCF supports its dividend and lowers potential downside. This fits as a defensive income stock.

#### Competitive advantages

It has a quasi-monopoly in Indonesia's fixed line and broadband infrastructure. It benefits from strong network effects (more subscribers = more scale). Government support also gives stability.

A moderate moat.

#### Growth drivers

Key drivers are continued broadband expansion and digital services. It is aggressively rolling out 5G and expanding fiber, as 2025Q1 capex of IDR5T was 50% on fiber/5G (Telkom, 2025). Data

revenues are also growing. Near-term, catalysts will be higher 5G adoption and Metro Ethernet expansion. Furthermore, recent management restructuring and focus on digital transformation may speed up margin improvements (Marketing-Interactive, 2025)

#### Risks

Regulatory risk is significant: mandates to open infrastructure (wholesale fiber requirements) could hurt margins. Competitive pressure is also rising in mobile from XL and Indosat. A slowdown in consumer spending could also hurt. Furthermore, fixed-line legacy services continue to erode.

#### Competition

Main competitors are Indosat and XL Axiata in mobile. In broadband, it competes with Biznet.

#### Technical

From Sep 2024 to Apr 2025, TLKM trended down, but reversed in May 2025, peaking at resistance 3,490 and now forming a higher low near 2,990. Using 50- and 200-day MAs, short-term price is above averages, while long-term is mixed but turning positive. Monthly net volume shows ~1,445M selling pressure. In 1Y, TLKM returned +1.97% vs LQ45's -16.34%, outperforming strongly. Overall, trend reversal, price above short-term MAs, and outperformance confirm a moderately positive outlook, aligning with fundamentals.

## 2.4 ASII (15%)

A diversified industrial conglomerate (autos, heavy equipment, agribusiness, financial services).

#### Growth and profitability

In 2024, revenue grew ~4.5% to IDR330.9T (StockAnalysis). Net income grew flat at ~0.65%. 5 year revenue growth has been very volatile. A big post-Covid rebound in 2021 (+29%), then moderate growth in 2022-2023, and slowing down in 2024. Margins have slightly compressed, with gross margins at ~21%, and net margins at ~10% in 2024. Free cash flow has been volatile, reflecting cyclical capex and working capital swings.

#### Balance sheet

D/E is low at ~0.37x in 2024. ROE at ~16.6%, and ROA ~5.9%.

#### Valuation

Valuation is attractive. Low P/E in 2024 at just 5.8x. Trailing P/E at ~6-7x, with forward P/E at ~6x. P/B is ~0.73x and P/S at ~0.6x. The PEG ratio is only ~0.56, reflecting slow growth and potential undervaluation. It is also attractive relative to historical valuations, as well as an attractive dividend yield of ~8.9%. This is our deep value/cyclical play, high upside if it recovers.

#### Competitive advantages

Diversified business franchise and dominant auto brand. It is the exclusive dealer for Toyota, Daihatsu, Isuzu, BMW, and more, giving it huge market share. It also has wide distribution networks, creating high barriers to entry. Overall, moderate moat. Strong brand and scale but cyclical.

auto brand.

#### Growth drivers

Key long-term drivers are vehicle sales (autos/motorcycles) as Indonesian incomes rise, and infrastructure/mining demand drives heavy equipment. And also the expansion into EVs, as it launched three new EV models and is building charging networks (IDNFinancials, 2024). Growth in EV adoption gives upside. Furthermore, with BI easing, consumer loan growth should accelerate, boosting Astra's auto and motorcycle sales. Government's expansionary fiscal policy will also lead to more public works which provides higher demand for construction vehicles and financing.

#### Risks

The cyclical. Automotive and heavy equipment sales drop in downturns. It also faces intense competition from Chinese EV entrants, which could pressure margins. Currency weakness (16,799/USD as of 25 September) can also raise import costs for vehicles, pressuring margins (Morningstar, 2025).

#### Competition

Competitors include imported cars like Honda. In heavy equipment, main rivals are smaller local dealers like Hexindo.

#### Technical

From September 2024 to June 2025, the stock trended down before breaking out in the last four months, peaking at 6,000 with support at 5,350. The price is now in an uptrend, forming higher highs and trading above both the 50- and 200-day MAs. Net volume is positive at ~711M, and relative strength shows +2.79% vs LQ45's -16.34%, confirming strong outperformance. Overall, technicals point to a clear breakout with sustained momentum, aligning with the stock's "deep value/cyclical recovery" thesis.

## 2.5 AALI (10%)

A plantation company supplying palm oil.

#### Growth and profitability

In 2024 it reported revenue of IDR 21.82T, a 5.2% increase from 2023 (StockAnalysis), driven by higher CPO prices and volumes. Net income was IDR 1.15T in 2024, up ~8.7% from 1.06T in 2023 (Astra Agro Lestari Tbk., 2025). Thin margins. Gross margin at ~14% in 2024, reflecting

commodity price swings, and net margins at ~5.3%. They fluctuate with CPO prices. Free cash flow is very cyclical as well.

#### Balance sheet

D/E is very low at only 0.14 in 2024. Returns are modest. ROE in 2024 was ~6%, rising from 4.8% in 2023. ROA at ~4.2%. These are below industrial peers and reflect the labor intensive, low margin nature of plantations.

#### Valuation

It trades at a low valuation given its cyclical earnings. TTM P/E is ~11.5x, and it was ~10.1x in 2024. P/B is below 1x, implying a discount. P/S at ~0.8x. Its PEG is around 1.3, showing fair valuation. Its dividend yield is 3-4%, moderate. Overall, the valuations look undervalued if we believe in the long-term demand for palm oil, but cyclicalities keeps the prices low. A small allocation into AALI will give us upside to any palm oil price rallies without making the portfolio overly cyclical.

#### Competitive advantages

Large scale (manages ~286,000 hectares). Large plantations allow economies of scale in harvesting and distribution. It also has the backing of Astra group. However, it has low pricing power because palm oil is a commodity with global prices set. There are also sustainability concerns. The moat is narrow.

#### Growth drivers

Indonesia's 9.7% YoY export growth in May 2025 was partly driven by palm oil (Reuters, 2025b). As a major planter, AALI benefits from strong external demand. Furthermore, the weak Rupiah may boost export earnings. Global demand drives these prices. Near term catalysts include a rally or stabilization in global CPO prices, as rising biodiesel demand and seasonal supply can increase margins and profitability quickly (Reuters, 2025d; UkrAgroConsult, 2025). Any expansion of planted area or yield improvements can boost volumes.

#### Risks

Commodity price volatility. A drop in global CPO prices will hit the company. Other risks like climate and labour shortages. Policy risks are related to changes in policies within the palm oil industry, both from the central and regional governments (Astra Agro Lestari Tbk., 2025).

#### Competition

Its primary competitor is PT London Sumatra, another large Indonesian planter, as well as Indofood Agri and Wilmar. Unlike industrial companies, plantation firms compete on cost of production. AALI's cost position is competitive due to scale.

#### Technical

From September 2024 to March 2025, the stock was in a downtrend, bottoming at 5,275 before reversing into an uptrend. It has since peaked at 8,975 with resistance at 10,300 and is now forming higher highs. The price trades above both the 50- and 200-day MAs, confirming the trend, while monthly net volume is positive at ~45M. Relative strength is strong, with the stock up +24.53% vs LQ45 down -16.34%. Overall, technicals confirm a clear reversal supported by positive momentum and outperformance.

### 3 Conclusion

#### 3.1 Fundamental and Technical Analysis Conclusion

Overall, our portfolio prioritizes financials and infrastructure for steady income, with smaller positions in cyclical or industrials. We heavily weigh banks because we are confident in Indonesia's long-term domestic growth and consumer credit, which also provides high dividends and a hedge against drawdowns because of the volatility of the smaller weightings. We have a high-risk tolerance, so we mixed strong companies with value-cyclicals to give more upside potential. Each weight matches with their individual strengths and our convictions in them. BBRI and BBCA as the top banks, TLKM as the top telco, ASII as a diversified conglomerate, and AALI for cyclical upside potential in palm oil prices. This will take advantage of long-term fundamentals and also near-term catalysts.

From a technical standpoint, BBRI and BBCA remain in clear downtrends with persistent selling pressure and underperformance versus the LQ45 index, indicating that their technical signals currently contradict their fundamentally positive outlooks. In contrast, TLKM shows a recent breakout with price above short-term moving averages and strong outperformance versus LQ45, ASII has confirmed an uptrend with price above both moving averages, positive net volume and outperformance, and AALI has completed a clear reversal into an uptrend with strong relative strength, so these latter three stocks' technicals broadly confirm their fundamentally positive or recovery-based cases.

#### 3.2 Justification

Our portfolio is built to take advantage of Indonesia's growth while balancing cyclical opportunities and defensives for stability. Fundamentally, banks like BBCA and BBRI are resilient due to their strong balance sheets, wide moats, and their ability to benefit from lower interest rates and rising credit demand due to lower borrowing costs, however, we need to also be wary because it may decrease the profitability by reducing their NIM. TLKM provides consistent and steady cash flow, a high dividend, and defensive support. ASII offers undervaluation,

diversification, and cyclical upside, while AALI provides exposure to global commodity cycles and serves as a hedge against Rupiah devaluation.

### 3.3 What We Learned

Through this stock simulation, we were able to learn that the Indonesian stock market is heavily sensitive to both domestic macroeconomic conditions like BI's easing and government fiscal spending and external factors like USD strength, commodity prices, and foreign fund flows. A fundamentally strong company may underperform in the short-term if macro headwinds continue to dominate. We also learned that high dividend yields and strong fundamentals can provide a margin of safety, but cyclical sectors are highly volatile and require disciplined portfolio allocation.

### 3.4 Final Recommendation

We recommend a BUY on all five portfolio stocks at their current prices (AALI: IDR 7,775, BBRI: IDR 4,160, ASII: IDR 5,700, BBKA: IDR 7,725, TLKM: IDR 3,220). The recommended allocation (BBRI 30%; BBKA 25%; TLKM 20%; ASII 15%; AALI 10%) balances growth, resilience, and cyclical upside. This portfolio is designed not only to outperform LQ45 over the next 6-12 months by taking advantage of near-term catalysts such as BI easing, loan growth, fiscal expansion, a cyclical palm oil rally and export resilience, but to also outperform in the long term. Furthermore, it'll also be able to generate resilient income with the high dividend yields provided by BBRI, TLKM, ASII, and BBKA to reduce downside volatility. Lastly, it'll also give asymmetric upside through cyclical/value plays like ASII and AALI.

However, we'll also have to be cautious of any potential downsides. First, a currency shock, and FX volatility, could renew the Rupiah weakness further and loss of investor confidence could cause massive outflows and pressure our stocks, especially cyclicals like ASII and AALI. Second, persistent lower NIMs for banks caused by easing compressing margins faster than loan growth grows could cause our banks to underperform. Last but not least, regulatory shocks to telco and plantation sectors like forced wholesale access for fiber or biodiesel policy shifts could weaken TLKM and AALI's margins.
